

Fine Gauge Conical Needle

**Increased Resilience to Breakage. Decreased Needle Marks
Compared to Standard Larger Gauge Styles.**

Foster Needle has developed a new tapered design for its fine gauge 38, 40, and 42GA conical style needle.

The design offers a fine taper on the conical working blade, and provides a unique blend from the working blade section through the transition area of the needle, and into the intermediate section. This has produced a stronger needle without the “thickness” of the “larger” gauge styles previously used.

This new needle provides excellent strength and durability in the pre-needle section of the production line for products requiring a smooth or “mark free” surface appearance, but also needing a “strong” needle because of occasional needle breakage associated with the pre-needle loom. It is great for applications in lightweight natural fiber, production of hobby felts, etc., to name a few.

For more information, contact your local Foster Needle agent or salesperson.
